

SOUTH FRASER PERIMETER ROAD PROJECT

Key Features of This Section

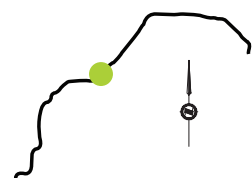

The SFPR Project includes construction of the **Alex Fraser Tidal Wetland**, located on the northern shoreline of the Fraser River on Annacis Island under the Alex Fraser Bridge. This wetland consists of high value habitat that provides a nursery and rearing home for young salmon and other fish, and is also used by aquatic insects and birds. This wetland has been thriving since it was constructed in 2009.

Construction of the wetland included:

- A connection to the Fraser River, which provides tidal water to the area
- Wildlife trees
- Woody debris for breeding habitat
- Native shrub and tree species

A **Rain Garden** was established near the lower reaches of Cougar Creek under the Alex Fraser Bridge, and near the trailhead of the Delta Nature Reserve Trail. Approximately 450 native shrubs and trees were planted to help with water-runoff management and to provide aesthetic improvements to the trailhead area. The rain garden was a joint effort by the Ministry of Transportation and Infrastructure and volunteers from the Delta Burnsvie Secondary School and the Cougar Creek Streamkeepers.
